

The image shows three white wind turbines standing on a grassy hill. The turbines are positioned in a line, with the one on the left being the largest and most prominent. The sky is a clear, bright blue, and the ground is covered in green grass. The overall scene is a clean, modern representation of renewable energy.

Market review

Economic and market review

Global bond investors had become jittery

Globally, yields in some of the bigger developed government bond markets increased sharply during the month as nervous investors reduced exposure on concerns that the Federal Reserve would resume policy normalisation, while other central banks may ease on unconventional policy measures. In the case of the US Treasury market, the yield of the 10-year bond increased by around 50 basis points since the low of 1.36% in early July this year, reaching the highest level since May. In the case of the UK and Germany, the yield spike came through with a vengeance this month. In the UK, the 10-year yield increased from 0.75% to 1.26% while the 10-year Bund yield broke back from negative into positive territory. These are all significant negative price movements and a painful reminder of the dangers of being too focused on yield, especially at these unprecedented low levels.

Global jitters contribute to foreign selling of local bonds

As could be expected, the above development had a direct negative impact on the local bond market. In contrast to the last few months, foreign investors reduced their RSA local currency debt holding by around R13 billion during October. Although a mere drop relative to the estimated total foreign holding just short of R0.6 trillion, it nonetheless contributed to significantly higher market volatility. Of course, local politically related developments once again also played a role.

Local data more or less in line with expectations

Regarding data releases, the broader trends of very weak underlying economic activity, a deceleration in the rate of inflation and some stabilisation in the external trade deficit remain unchanged. Although the Minister of Finance once again did well to find a balance between a very challenging macro-economic backdrop and the need to provide proof of the commitment to fiscal consolidation – the Medium Term Budget Policy Statement was fairly uninspiring. Although we cannot fault the numbers too much, even though we observed some slippage relative to the February commitments, we remain unimpressed by the lack of steps geared towards addressing the old structural issues that continue to hamper a higher economic growth rate.

Volatile month for bonds ended relatively well

Against this backdrop, the yield of the benchmark R186 (maturity 2026) gyrated between a best level of 8.55% and weakest of 8.92%, before closing the month five basis points weaker at 8.70%. Following the sell-off since May this year, inflation-linked bond yields stabilised at higher levels in October; the result of improved valuation and expectations of a temporary rise in Headline CPI over the next few months. For the month, the JSE All Bond Index returned 0.6%, matching the returns of both the official inflation-linked index's return and cash. On a year-to-date basis, ended 31 October, nominal bonds are still leading the trio with a total return of 15.8%, followed by inflation-linked bonds at 7.8%, while cash returned 5.6%.

Key macroeconomic themes

Economic growth

A mild, uneven global economic recovery remains our base case, with a relatively strong US economy leading the way. In contrast, euro zone growth remains challenged while prospects for Japan look particularly poor. We believe that the global recovery will be structurally lower than in previous cycles, mainly due to lower productivity growth, ongoing broad-based balance sheet repair (deleveraging) and shifting demographics (older populations tend to save more and spend less). BREXIT is another factor that is driving uncertainty about the prospects for a more sustained global recovery.

Most emerging market economies are caught between a mixed outlook for the developed world, the implication of structurally lower Chinese economic growth on commodity demand and the US Federal Reserve's well telegraphed intent to normalise monetary policy. Therefore, commodity producers with large external imbalances, such as SA, remain particularly vulnerable.

Locally, the biggest impediment to higher local growth remains of a more structural nature. The second quarter's higher GDP growth rate is unsustainable and this is supported by disappointing manufacturing, mining and retail data releases during the third quarter. Encouragingly, overdue engagement between government and business raises the prospect of unbundling domestic growth potential – but prompt and practical follow through is still necessary for it to be impactful. Quite frankly, the jury is still out on actual delivery, which if it happens, can only be expected to produce results in the long run.

Inflation

Global inflation trends are likely to remain subdued in our view. Final demand is simply not strong enough. If any, we believe that central banks in the developed world should revisit the general dogmatic pursuit of a 2% inflation target and the appropriate level of so-called price stability.

Locally, a milder than previously envisioned food inflation forecast, fairly stable crude oil prices and recent rand appreciation have forced down our 2016 and 2017 annual average inflation forecasts to 6.3% and 5.4% respectively. We temper excitement about the expected lower future inflation path simply because a level of around 5% is still too far above the bottom end of the inflation target range and actual inflation in many parts of the globe. Banking on continued currency depreciation to maintain global competitiveness is unsustainable in the long run. The central bank has no option but to prioritise and target price stability at a lower level.

Balance of payments

The combination of years of rand weakness and an improved terms of trade position is finally lending relief to the fragile balance of payment situation. As a result, we expect a narrowing in the current account deficit from an annual average of 4.4% in 2015 to 3.7% in both 2016 and 2017. However, even at these lower levels, SA is still saddled with a relatively weak external trade position, which in turn will remain a drag on the currency. The unfavourable and growing income account deficit (primarily comprised of net dividend and interest payments to foreigners), has become a significant drag on a sustained and meaningful balance of payments recovery. One of the dark sides of the foreign rush into local currency debt is exactly this; unless of course coupons are re-invested, which we do not know for certain.

Key macroeconomic themes *continued*

Monetary policy

Having finally started the long awaited and well telegraphed monetary policy normalisation process, we agree with the Federal Reserve's intent to follow a slow and gradual process. With an unemployment rate just below 5%, wages slowly rising and the more stable core inflation rate hovering above 2%, we feel strongly that the Federal Reserve should resume the normalisation process at the first available opportunity, but for obvious reasons at an appropriately slow pace.

The current trend of global monetary policy divergence is expected to continue over the next year or so. With more policy tightening in the US on the cards, the European Central Bank and Bank of Japan will retain their quantitative easing and negative interest rate policy programmes, with some tweaks. At the same time, some of the smaller advanced and commodity-driven economies may be forced to ease policy, mainly due to below-trend economic growth and a modest inflation backdrop. On the positive side, monetary policy divergence will act to soften the impact of higher US rates on global growth.

In the case of SA, we feel comfortable with the prospects of the South Africa Reserve Bank (SARB) being at the peak of the interest rate tightening cycle. A cautious approach is supported by the weak economic growth backdrop, low levels of credit extension growth and limited evidence of demand-led inflation. However, considering the size of the balance of payments deficit and the stickiness of inflation (in the upper end of the target range), we deem a neutral policy stance (thus no cuts) as the most appropriate.

Fiscal policy

The Minister of Finance followed the realistic and balanced national budget delivered in February, with a reasonable Medium Term Budget Policy Statement considering very challenging circumstances. However, we cannot ignore the marginal slippage relative to the February commitment on the planned consolidation path, which has indeed confirmed our fears of elevated execution risk in the outer years of the Medium Term Expenditure Framework. While bearing cognisance of a raft of new policies aimed at improving the governance of SOEs, the financial state of some state-owned enterprises, and the implications for a finely balanced fiscal position, remain a significant concern. Recent changes at SAA are not entirely convincing either. In addition, some SOEs appear to act in contravention of the Public Finance Management Act as demonstrated by recent events at the Strategic Fuel Fund. Our concern about the implication on the already high level of contingent liabilities at a national level remains elevated.

At a macro level, our perception is that discussions around structural economic reforms appear to have reached a stalemate. A number of policy initiatives are still unresolved. This includes important changes to mining legislation and labour market reforms, specifically the issue around strike ballots and minimum wages. The risk we run from a credit ratings perspective is that the lack of promised structural reforms start weighing more than the strengths offered by monetary and fiscal policy credibility.

Investment view and strategy

The global growth recovery remains fragile and patchy, which sets the scene for a modest future inflation profile as well as significant monetary policy divergence. It also implies a steady and shallow tightening cycle for the few economies that are in a position to normalise monetary policy, especially the US. This should cap global bond yields. On the negative side, the continued uncertainty about the global, and particularly the Chinese, growth outlook remains a risk – especially for emerging market commodity producers with a weak external position in both absolute and relative terms, like South Africa. We also expect global risk appetite to remain volatile and do not regard market rallies boosted by expectations of more policy easing to be sustainable. If any, we are starting to fear that the unintended consequences of unprecedented monetary policy measures among the major developed market central banks should not be ignored. Monetary policy has lost its effectiveness on final demand and instead has caused major distortions, mainly across developed bond markets. This requires a serious consideration of a change in the policy mix. The impact of fiscal spending on final demand tends to be more effective.

Locally, we still expect a bout of upward pressure on inflation over the next three to four months, but are more focused on the downward trend expected for next year. While the South African Reserve Bank has now adopted a neutral bias, it is unlikely that they would consider interest rate cuts soon. The external imbalance is simply too big to allow for a lower real repo rate, while unpredictable currency swings continue to pose a risk to the more benign inflation outlook. Although the Minister of Finance is clearly determined to rectify the damage to fiscal policy credibility and, by implication, to avoid a sovereign credit downgrade to non-investment grade status, the jury is still out on actual delivery. Therefore, the risk of a credit rating downgrade over the next 12 months still hovers. In the short term, local political uncertainty remains a nagging risk. This is particularly worrying considering how much risk has been priced out of the market since the end of last year, mostly the result of the global reach for yield which has managed to whitewash the economic and policy sins of South Africa.

Considering the above, we will continue to approach the market with caution. The emphasis therefore remains on capital preservation. This is expressed by the large underweight modified duration and 12+ year nominal bond positions. We have reduced our inflation-linked bond holding significantly in response to the more benign twelve month inflation outlook and have instead opted to create an overweight position in short- and medium-dated nominal bonds. The biggest risk to our cautious stance is sustained net foreign inflows into the local nominal bond market.

Our broad interest rate investment strategy for a core bond fund benchmarked against the ALBI is as follows:

- Modified duration – Underweight (70% of maximum allowable range)
- Cash – Small overweight
- Nominal bonds (1-12 years) - Overweight
- Nominal bonds (12+ year) - Underweight
- Inflation-linked bonds – Zero holding
